

Sitelink Ranking Plan

worldoftools.in

A structured plan to earn Google sitelinks for the homepage while ranking multiple pages independently.

WHAT GOOGLE NEEDS TO SHOW SITELINKS

Google auto-generates sitelinks for sites that have **strong internal hierarchy**, **each candidate page ranking on its own keyword**, and **consistent branded search volume**. You cannot request them — but you can engineer the three conditions that trigger them: clear site architecture, independently ranking sub-pages, and structured data signals.

THE 5 SITELINK CANDIDATES

These are the pages most likely to appear under a branded 'worldoftools' search.

#	URL	Target keyword	Priority
1	Calculators Online /calculators-online	online calculators free india	HIGH
2	Developer Tools Online /developer-tools-online	free developer tools online	HIGH
3	SEO Tools Free /seo-tools-free	free seo tools online	MED
4	Text Tools Online /text-tools-online	online text tools free	MED
5	Web Utilities Free /web-utilities-free	free web utilities online	MED
6	Guides (Blog) /guides/	how to use [tool] guide	LOW

INTERNAL LINKING ARCHITECTURE

Internal linking is the **single most controllable sitelink signal**. Google traces links to determine which pages are official 'branches' of your homepage.

1

Homepage → category pages via primary nav

All 5 category pages must appear in the site's primary navigation — not just the body. Nav links carry 2–3x more weight than body links. Use exact anchor text matching the keyword: 'Calculators Online', 'Developer Tools Online', etc.

- 2

Category pages → all tools within them
Each category page should list and link to every tool in its group. This tells Google the category page is the topical hub and passes equity down to individual tools.
- 3

Every tool page → its parent category (breadcrumb)
Add a breadcrumb on every tool page: Home > Calculators Online > EMI Calculator. This upward link reinforces the hub-spoke hierarchy Google needs to assign sitelinks.
- 4

Related tools cross-links (3–4 per tool page)
On each tool page, link to 3–4 tools in the same category under a 'Related Tools' section. E.g. EMI Calculator → GST Calculator, SIP Calculator, Loan Eligibility. Builds topical clusters and keeps crawlers within a category.
- 5

Guides <-> tool pages (bidirectional)
Each guide page should link to its corresponding tool, and the tool page should link back to the guide. This authority loop helps guide pages rank for informational queries independently.

STRUCTURED DATA (SCHEMA MARKUP)

Schema doesn't directly create sitelinks but signals site structure and enables a **Sitelinks Search Box** in branded results — the clearest sitelink trigger available.

Page	Schema type	Why it matters
Homepage	WebSite + SearchAction	Enables sitelinks search box in branded SERP
All pages	BreadcrumbList	Strongest hierarchy signal Google reads for sitelinks
Category pages	CollectionPage + isPartOf	Signals these are hub pages, not individual tools
Tool pages	WebApplication + isPartOf	Identifies tools as interactive apps in the same hierarchy
Guide pages	Article + isPartOf	Separates guides as informational content in site structure

Critical: The **WebSite schema with SearchAction** on the homepage is the single highest-impact schema for sitelinks. Set **potentialAction.target** to your site's search URL template.

TECHNICAL SIGNALS GOOGLE CHECKS

Signal	Requirement	Priority
XML Sitemap	Submit at /sitemap.xml — category pages priority 0.9, tools 0.7	HIGH
HTTP status	All 5 category pages must return 200 — no redirect chains	HIGH
robots.txt	Category pages must NOT be blocked or noindexed	HIGH
Core Web Vitals	LCP < 2.5s, CLS < 0.1 on category pages (mobile + desktop)	MED
Canonical tags	Every page needs a canonical URL to prevent authority dilution	MED
Mobile UX	Tap targets, font sizes — Google's mobile-first index affects sitelink selection	MED

4-WEEK ACTION PLAN

Week 1 Architecture

- Add all 5 category pages to primary site navigation with keyword-match anchor text
- Add breadcrumbs to every tool page (Home > Category > Tool)
- Implement WebSite + SearchAction schema on homepage
- Implement BreadcrumbList schema site-wide
- Submit XML sitemap to Google Search Console

Week 2 Internal linking

- Ensure every category page links to all tools within its group
- Add 'Related Tools' sections to top 10 tools (EMI, GST, JSON, IP, SIP, Age, BMI, Password, QR, Case)
- Add upward breadcrumb links on all tool pages back to their category
- Link each existing guide to its tool page and vice versa

Week 3 Schema markup

- Add CollectionPage + isPartOf schema to all 5 category pages
- Add WebApplication + isPartOf schema to top 15 tool pages
- Add Article schema to all guide pages
- Validate all schema using Google's Rich Results Test

Week 4 Authority + monitoring

- Submit site to Indian web directories and tool aggregator sites
- Build 5 contextual backlinks to category pages from finance/dev blogs
- Monitor Search Console for branded query impressions and sitelink appearance
- Check Core Web Vitals report — fix any LCP issues on category pages

Sitelinks typically appear within 4–12 weeks of implementing strong internal architecture and schema, assuming the site already has some branded search volume. The most critical steps are: nav links to all 5 category pages, breadcrumbs site-wide, and WebSite schema on the homepage.
